### **NEW QUESTION: 1**

You are designing an Azure web application. The solution will be used by multiple customers. Each customer has different business logic and user interface requirements.

Not all customers use the same version of the .NET runtime.

You need to recommend a deployment strategy.

What should you recommend?

- A. Deploy with multiple worker role instances.
- B. Deploy all applications in one tenant.
- C. Deploy each application in a separate tenant.
- D. Deploy with multiple web role instances.

### **Answer: C**

Explanation:

There are two types of tenant environments.

The simplest type is a single-tenant application where one customer has 100% dedicated access to an application's process space. A single Tenant Applications has a separate, logical instance of the application for each customer or client. A single tenant application is much more predictable and stable by its nature since there will never be more than one dedicated customer at any point in time in that VM. That customer has all of its users accessing that dedicated instance of the application.
