### NEW QUESTION: 3

You are developing a C# application that has a requirement to validate some string input data by using the `Regex` class.

The application includes a method named `ContainsHyperlink`. The `ContainsHyperlink()` method will verify the presence of a URI and surrounding markup.

The following code segment defines the `ContainsHyperlink()` method. (Line numbers are included for reference only.)

The expression patterns used for each validation function are constant.

You need to ensure that the expression syntax is evaluated only once when the `Regex` object is initially instantiated.

Which code segment should you insert at line 04?

A. Option D

B. Option B

C. Option C

D. Option A

**Answer: A**

Explanation:

`RegexOptions.Compiled` - Specifies that the regular expression is compiled to an assembly. This yields faster execution but increases startup time. This value should not be assigned to the `Options` property when calling the `CompileToAssembly` method.
