Answer:

Explanation:

Explanation

Box 1: Zone-redundant storage (ZRS)

Zone-redundant storage (ZRS) replicates your data synchronously across three storage clusters in a single region.

LRS would not remain available if a data center in the region fails

GRS and RA GRS use asynchronous replication.

Box 2: StorageV2 (general purpose V2)

ZRS only support GPv2.

NEW QUESTION: 4

An application developer needs to implement an event based loan eligibility application. The application receives a Loan Request event that carries the Customer Record.

Part of the loan eligibility application logic needs to extract the customer's personal information and use it to call a web service to retrieve the customer's credit score.

How can the application developer implement this logic?

A. 1. Implement an Event Handler agent for the Loan Request Event.

2. Develop a Java client to call the Web Service and package it as a JAR file.

3. Call the Java client from the Event Handler agent and pass the customer personal information to it.

B. 1. Create a rule agent.

2. Define the agent descriptor to process the Loan Request Event and extract the Customer Record.

3. Use the built in Web Service rule to invoke the Web Service, and pass the customer personal information to it.

C. 1. Create a Java agent.

2. Define the agent descriptor to process the Loan Request Event and extract the Customer Record.

3. Code the Java agent to use the customer personal information from the Customer Record to call the web service that returns the customer's credit score.

D. 1. Create a Web Service agent.

2. Configure the agent to listen to the Loan Request Event.

3. Implement the Web Service call by mapping the customer personal information from the Customer Record to the Web Service operation.
