#### **NEW QUESTION: 1**

A user wants to upload a complete folder to AWS S3 using the S3 Management console. How can the user perform this activity?

- A.** The user cannot upload the whole folder in one go with the S3 management console
- B.** Use the Enable Enhanced Folder option from the S3 console while uploading objects
- C.** Use the Enable Enhanced Uploader option from the S3 console while uploading objects
- D.** Just drag and drop the folder using the flash tool provided by S3

**Answer: C**

Explanation:

AWS S3 provides a console to upload objects to a bucket. The user can use the file upload screen to upload the whole folder in one go by clicking on the Enable Enhanced Uploader option. When the user uploads a folder, Amazon S3 uploads all the files and subfolders from the specified folder to the user's bucket. It then assigns a key value that is a combination of the uploaded file name and the folder name.

#### **NEW QUESTION: 2**

- A.** State modeling
- B.** Concept modeling
- C.** Decision modeling
- D.** Organizational modeling

**Answer: A**

### NEW QUESTION: 3

A company has locations in North America and Europe. The company uses Azure SQL Database to support business apps.

Employees must be able to access the app data in case of a region-wide outage. A multi-region availability solution is needed with the following requirements:

- \* Read-access to data in a secondary region must be available only in case of an outage of the primary region.
- \* The Azure SQL Database compute and storage layers must be integrated and replicated together.

You need to design the multi-region high availability solution.

What should you recommend? To answer, select the appropriate values in the answer area.

NOTE: Each correct selection is worth one point.

### Answer:

Explanation:

Explanation

Box 1: Standard

The following table describes the types of storage accounts and their capabilities:

Box 2: Geo-redundant storage

If your storage account has GRS enabled, then your data is durable even in the case of a complete regional outage or a disaster in which the primary region isn't recoverable.

Note: If you opt for GRS, you have two related options to choose from:

GRS replicates your data to another data center in a secondary region, but that data is available to be read only if Microsoft initiates a failover from the primary to secondary region.

Read-access geo-redundant storage (RA-GRS) is based on GRS. RA-GRS replicates your data to another data center in a secondary region, and also provides you with the option to read from the secondary region. With RA-GRS, you can read from the secondary region regardless of whether Microsoft initiates a failover from the primary to secondary region.

### NEW QUESTION: 4

A company runs a multi-tier web application that hosts news content. The application runs on Amazon EC2 instances behind an Application Load Balancer. The instances run in an EC2 Auto Scaling group across multiple Availability Zones and use an Amazon Aurora database. A solutions architect needs to make the application more resilient to periodic increases in request rates.

Which architecture should the solutions architect implement? (Select TWO )

- A. Add AWS Global Accelerator.
- B. Add an Amazon CloudFront distribution in front of the Application Load Balancer
- C. Add AWS Shield.
- D. Add Aurora Replicas
- E. Add AWS Direct Connect

**Answer: A,B**

Explanation:

AWS Global Accelerator

## Acceleration for latency-sensitive applications

Many applications, especially in areas such as gaming, media, mobile apps, and financials, require very low latency for a great user experience. To improve the user experience, Global Accelerator directs user traffic to the application endpoint that is nearest to the client, which reduces internet latency and jitter. Global Accelerator routes traffic to the closest edge location by using Anycast, and then routes it to the closest regional endpoint over the AWS global network. Global Accelerator quickly reacts to changes in network performance to improve your users' application performance.

### Amazon CloudFront

Amazon CloudFront is a fast content delivery network (CDN) service that securely delivers data, videos, applications, and APIs to customers globally with low latency, high transfer speeds, all within a developer-friendly environment.
