CORRECT TEXT
You want to create a boot floppy using a given image file on your hard disk. What utility would you
use to do so?
Answer:
Explanation:
mkbootdisk
--device /dev/fd0 `uname -r`
mkbootdisk creates a boot floppy appropriate for the running system. The boot disk is entirely self-
contained, and includes an initial ramdisk image which loads any necessary SCSI modules for the
system. The created boot disk looks for the root filesystem on the device suggested by /etc/fstab.
The only required argument is the kernel version to put onto the boot floppy.
Syntax: mkbootdisk [options] kernel version.
Bydefault mkbootdisk creates the boot disk on first floppy device. If you want to specify the device
use the --device option. We can print the kernel version using uname -r command.
