NEW QUESTION: 2
Refer to the exhibit.

Which statement about this device configuration is true?
A. The device will allow anyone to poll it via the public community.
B. The NMS needs a specific route configured to enable it to reach the Loopback0 interface of the device.
C. The device configuration requires the AuthNoPriv security level.
D. The ifindex of the device could be different when the device is reloaded.
Answer: D
Explanation:
One of the most commonly used identifiers in SNMP-based network management applications is the Interface Index (ifIndex) value. IfIndex is a unique identifying number associated with a physical or logical interface. For most software, the ifIndex is the name of the interface. Although relevant RFCs do not require that the correspondence between particular ifIndex values and their interfaces be maintained across reboots, applications such as device inventory, billing, and fault detection depend on this correspondence. Consider a situation where a simple monitoring software (like MRTG) is polling the interface statistics of the router specific serial interface going to the internet.
As an example, you could have these conditions prior to re-initialization:
physical port ifIndex
ethernet port
1
tokenring port
2

serial port
3
Therefore, the management application is polling the ifIndex 3, which corresponds to the serial port.
After the router re-initialization (reboot, reload and so on) the conditions change to something similar to this:
physical port ifIndex
ethernet port 3 tokenring port 1 serial port 2 The management application continues polling the ifIndex 3, which corresponds now to the ethernet port. Therefore, if the management application is not warned by a trap, for example, that the router has been rebooted, the statistics polled could be completely wrong.
