On a Red Hat system, with a single floppy drive and a returned output from the uname command
of 2.4.20-12, what exact command string will create a customized boot disk for this system? Type
the full command string to accomplish this.
Answer:
Explanation:
mkbootdisk --device /dev/fd0 2.4.20-12

Explanation:
mkbootdisk creates a boot floppy appropriate for the running system. The boot disk is entirely self-
contained, and includes an initial ramdisk image which loads any necessary SCSI modules for the
system. The created boot disk looks for the root filesystem on the device suggested by /etc/fstab.
The only required argument is the kernel version to put onto the boot floppy.
Syntax: mkbootdisk [options] kernel version.
Bydefault mkbootdisk creates the boot disk on first floppy device. If you want to specify the device
use the --device option. We can print the kernel version using uname -r command.
