NEW QUESTION: 2

What three data components are needed for data recovery?

- A. The backup log.
- B. The slow log.
- C. configuration files.
- D. The general log.
- E. The data backup.
- F. The binary log.

Answer: C,E,F

Explanation:

D: Incremental backups are made possible by enabling the server's binary log, which the server uses to record data changes.

D: The data backup is the main component of a backup.

F: A physical backup includes configuration files.

Note: Logical backups save information represented as logical database structure (CREATE DATABASE, CREATE TABLE statements) and content (INSERT statements or delimited-text files). Physical backups consist of raw copies of the directories and files that store database contents. Logical backup methods have these characteristics:

The backup is done by querying the MySQL server to obtain database structure and content

information.

Backup is slower than physical methods because the server must access database information and convert it to logical format. If the output is written on the client side, the server must also send it to the backup program.

Output is larger than for physical backup, particularly when saved in text format.

Backup and restore granularity is available at the server level (all databases), database level (all tables in a particular database), or table level. This is true regardless of storage engine.

The backup does not include log or configuration files, or other database-related files that are not part of databases.

Physical backup methods have these characteristics:

The backup consists of exact copies of database directories and files. Typically this is a copy of all or part of the MySQL data directory.

Data from MEMORY tables cannot be backed up this way because their contents are not stored on disk.

Physical backup methods are faster than logical because they involve only file copying without conversion.

Output is more compact than for logical backup.

Backup and restore granularity ranges from the level of the entire data directory down to the level

of individual files. This may or may not provide for table-level granularity, depending on storage engine. (Each MyISAM table corresponds uniquely to a set of files, but an InnoDB table shares file storage with other InnoDB tables.)

In addition to databases, the backup can include any related files such as log or configuration files.
