NEW QUESTION: 2
You create a view object "CustomersVO" based on an entity object "CustomerEO". How would you
declaratively change the result set returned from the view object so that the records are sorted by
customer name? (Choose the best answer.)
A. Create a view criteria on CustomersVO to order by the CustomerNameattribute.
B. Re-order the attributes in the CustomersVO editor such that the CustomerNameattribute is listed first.
C. Add ORDER BY CustomerNameto the query in CustomerEO.
D. Change the CustomersVO query mode to "Expert" and define the query using the ORDER BYclause as
required.
E. Add ORDER BY CustomerNameto the query in CustomersVO.
Answer: D
Explanation:
Explanation/Reference:
The setOrderByClause method sets the ORDER BY clause of the view object's query statement. Bind
variables can be specified using '?' as a place-holder for the value. The new ORDER BY clause does not
take effect until RowSet.executeQuery() is called.

NEW QUESTION: 3
While opening an email attachment, Pete, a customer, receives an error that the application has encountered an unexpected issue and must be shut down. This could be an example of

which of the following attacks?
A. Header manipulation
B. Buffer overflow
C. Cross-site scripting
D. Directory traversal
Answer: B
Explanation:
When the user opens an attachment, the attachment is loaded into memory. The error is caused by a memory issue due to a buffer overflow attack.
A buffer overflow occurs when a program or process tries to store more data in a buffer (temporary data storage area) than it was intended to hold. Since buffers are created to contain a finite amount of data, the extra information - which has to go somewhere - can overflow into adjacent buffers, corrupting or overwriting the valid data held in them.
Although it may occur accidentally through programming error, buffer overflow is an increasingly common type of security attack on data integrity. In buffer overflow attacks, the extra data may contain codes designed to trigger specific actions, in effect sending new instructions to the attacked computer that could, for example, damage the user's files, change data, or disclose confidential information. Buffer overflow attacks are said to have arisen because the C programming language supplied the framework, and poor programming practices supplied the vulnerability.
